Human chromosome 1 international sequencing consortium;
Submitted (MAY-2005) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: May be involved in transcriptional regulation.
-!- SUBCELLULAR LOCATION: Nucleus (Potential).
-!- SIMILARITY: Contains 1 BTB (POZ) domain.
-!- SIMILARITY: Contains 2 C2H2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BB970D200B60CC9F CRC64;

Also expressed in adult testis. In embryonic brain, expressed in a subset of postmitotic neurons generated posterior to the midbrain-hindbrain border. In the developing spinal cord, selectively expressed in dorsal horn interneurons. SIMILARITY: Belongs to the SKI family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Missing (in isoform 3).

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL3011), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II beta beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, Also described; (l) a pharmaceutical composition class II component. Also described: (l) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigan-specific T cell; (4) a method of directly identifying an autigan-specific T cell; (4) a method of regulating an immune response ex vivo in a subject; and (c) a method of treating an immune response ex vivo in a subject; and continued, antibacterial, antiparasitic, cytostatic and immunosuppressive activities, and can be used in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune classifications, neoplastic disease, autoimmunity or toxicity. The present configurations, neoplastic disease, autoimmunity or toxicity. The present sequence represents a spaceholder molecule peptide, which can be used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                               MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparasitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human.

                                                                                                                WO2004099242-A2.
                                                                                                                                             18-NOV-2004
                                                                                                                                                                                                                                                                                                                                                                             infection.
 The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN7126 and antibacterial bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a bilogical sample. (I) is used to detecmine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity charted may be used in gene therapy, humunoassays, and distinguishing/identifying
                                                                  Streptococcus, GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                  New Streptococcus protein for the treatment or prevention of infection disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                 Fraser C;

The invention describes an isolated nucleic acid molecule encoding a hyperimmune serum reactive antigen or its fragment. Also described are: a vector comprising the nucleic acid molecule; a host cell comprising the vector, a hyperimmune serum-reactive antigen comprising a sequence encoded by the nucleic acid molecule and consisting of e.g., 85, 299, 467 or 812 amino acids; fragments of hyperimmune serum reactive antigens consisting of peptides comprising e.g., 76, 114, 221 or 576 amino acids; a process for producing a Streptococcus agalactiae hyperimmune serum reactive antigen; a process for producing a cell that expresses a S. C. agalactiae hyperimmune serum reactive antigen; a pharmaceutical composition, especially a vaccine, comprising the hyperimmune serum cactive antigen; a part of the hyperimmune serum-reactive antigen; a method for nucleic acid molecule; an antibody that binds at least to a selective part of the hyperimmune serum-reactive antigen; a method for identifying an antagonist capable of binding to the hyperimmune serum-reactive antigen; a method for identifying an antagonist capable of binding to the hyperimmune serum-reactive antigen to its interaction partner; a process for in vitro diagnosis of a bacterial infection, especially a S. agalactiae infection. The hyperimmune serum reactive antigen is useful for searching and/or identifying an interaction partner; and/or identifying an interaction partner of the hyperimmune serum reactive antigen, and a process for in vitro diagnosis and/or identifying an interaction partner of the hyperimmune serum reactive antigen, eactive antigen, eactive antigen, eactive antigen, eactive antigen, especially a S. agalactiae in sectul for reactive antigen, eactive encomprises anticalines or for the manufacture of a functional nu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acid comprising ribozymes, antisense nucleic acids or siRNA. The nucleic acid molecule, hyperimmune serum-reactive antigen or antibody is useful for the manufacture of a vaccine against S. agalactiae infection. This is the amino acid sequence of a Streptococcus agalactiae hyperimmune serum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 1310;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 42; DB 8; Length 131

The present invention relates to novel Streptococcus agalactiae

uncleotide sequences (1; ADV78860-ADV78998 and ADV83341-ADV85496) and

uncleotide sequences (1; ADV78899-ADV81203 and ADV81205-ADV83340). The

nucleotide sequences encode polypeptides of S. agalactiae involved in the

synthesis of amino acids, cell membranes, intermediate (central)

metabolism, energetic metabolism, fatty acid and phospholipid metabolism,

cucleotide metabolism including purines, pyrimidines and/or nucleosides,

regulatory functions, replication, transcription, translation, protein

transport, adaptation to atypical conditions, sensitivity to medicines

cofactors, prosthetic groups and transporters, cell membrane proteins and

cofactors, prosthetic groups and transporters, cell membrane proteins and

cofactors, prosthetic groups and transporters, cell membrane proteins and

colactors, prosthetic groups and transporters, cell membrane proteins and

colactors, prosthetic groups and transporters, cell membrane proteins

colactors prosthetic groups and transporters, cell membrane process

colactors process agalactical composition comprisingly (1) or (11) are

general for treatment of a bacterial is given in ADV81204, Note: The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADV82959;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel Streptococcus agalactiae
nucleotide sequences (1; ADV87607-ADV87745) and novel polypeptides (II;
ADV87746-ADV89550). The nucleotide sequences encode polypeptides of S.
agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, cpyrimidines and/or nucleosides, regulatory functions replication, transportion, transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the present basic patent FR2824074A1. WO200292818A2 is equivalent for the present basic patent FR2824074A1. WO200292818A2 contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7777-ABBS2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     osteopathic; vulnerary; cytostatic; gene therapy; diagnosis; forensics; gene mapping; mutation identification; biodiversity; chromosome marker; immune response; myeloid cell disorder; lymphoid cell disorder; bone cartilage; tendon; ligament; nerve tissue growth; wound healing; burns; incision; ulcer; cancer.
                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                           Disclosure, SEQ ID NO 21255, 21pp + Sequence Listing, English.

The invention relates to novel isolated polymucleotides or a sequence encoding a polypeptide with biological activity, where the polymucleotide with biological activity, where the polymucleotide or the polymucleotide under stringent hybridization conditions or has greater than 99% sequence identity with the polymucleotide. The conjunction of mutations responsible for genetic gene mapping, identification of mutations responsible for genetic disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polymucleotides may also be used as molecular course, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polymothides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell cliscues; in home cartilage, tendon, ligament and/or nerve tissue growth or regeneration, in wound healing, in tissue repair and replacement, in the reginer or this course. This New polynucleotides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and sequence corresponds to a protein sequence of the invention. Claim 20; SEQ ID NO 173; 243pp; English.

This invention relates to novel isolated plant nucleic acid molecules, or variants thereof, that encode transcription factors. Specifically, it refers to transcription factor proteins that are capable of binding to DNA in order to require gene transcription and gene expression in a plants, in particular Eucalyptus grandis and Pinus radiata. The present invention describes DNA constructs containing DNA encoding a transcription factor that regulates the promoter, which is operably linked to the desired nucleic acid to be expressed. It further provides transgenic plants expressing a transcription factor that confers a trait to the plant such as increased drought, salt or disease tolerance, height nucleic, enhanced cold, frost tolerance, enhanced color, health and nutritional characteristics, as well as improved taste, starch 占 composition, flower longevity and germination, amongst others.
Accordingly, such plants that are successfully transfected with a DNA construct can be characterized by a difference in flower color, petal or leaf shape and size, aroma or plant height. This polypeptide is a plant transcription factor protein sequence of the invention. Claim 31; SEQ ID NO 948; 1265pp; English.

```
The invention describes a transgenic plant comprising a recombinant belonged of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: chhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in steem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced crichome development; altered trichome trichome trichome number; altered stem morphology; cincreased root growth; increased root hairs; altered seed development; caltered cell proliferation or cell differentiation; rapid development; premature senescence; increased nor cell differentiation; rapid development; premature senescence; increased necrosis; increase in seedling or plant of size; decreased plant size; leaf morphology; seed morphology; seed conthocyanins, or alteration in light response or shade avoidance. The anthocyanins; increase in plant can be useful in bioinformatic search methods. This is the amino acid sequence of a plant transgenic plant with altered traits can be used in the transcription factor, and an orthologue of Arabiodopsis thaliana creation of a transgenic plant with altered traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```
polymucleotide having a polymucleotide sequence or its complementary sequence comprising a sequence encoding a polypeptide, that initiates transcription (i.e. a transcription factor) from Arabidopsis, Soybean, Nic., Rape or Corn, comprising any of the sequences appearing as AD001588 -AD003527 or AD003530-AD003559. Also included are using a transgenic plant to grow a progeny plant, an expression cassette (comprising a constitutive, inducible or tissue-specific promoter and a recombinant polymucleotide described above), a host cell comprising the expression cassette, producing a modified plant having a modified trait, identifying a factor that is modulated by or interacts with a polypeptide encoded by the polymucleotide sequence and identifying at least one downstream polymucleotide sequence that is subject to a regulatory effect of any of the polypeptides encoded by the polymucleotide described above. The transgenic plant is useful for producing a plant that has an altered transgenic plant, susful for producing a plant that has an altered transgenic plant, and encoded polymucleotide sequence to abjoric stress (increased tolerance to chilling, germination in cold conditions, freezing tolerance to theat, tolerance to the heat, tolerance to semotic stress, tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New transgenic plant, useful in developing phenotypes with altered or improved characteristics or traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a transgenic plant comprises a recombinant

The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61384-ADO6379). The equences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a nathered trait selected from increased tolerance to abiotic stress, increased tolerance to cold, increased tolerance to disease, including increased tolerance to disease, including disease and particularly Erysiphe, Pusarium and Botrytis, cold particularly Erysiphe, Pusarium and Botrytis, increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABC, altered sugar sensing, increased tolerance to cold sease and particularly Erysiphe, Pusarium and Botrytis, cold sensitivity to ABC, altered sugar sensing, increased tolerance to calcard sensitivity to ABC, altered sugar sensing, increased tolerance to calcard sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABC, altered sugar sensing, altered shoot meristem development, altered branching pattern, altered shown morphology, altered vascular tissue structure, reduced tertility altered shoot meristem development, altered branching pattern, altered seed trichome structure, altered cold proliferation, altered cold expendition, altered cold expendition, altered cell expension, altered bhase calcarded blomass, large seedlings dwarfed plants, dark growth, altered cell proliferation, altered cell expension altered sensecence, abnormal embryo development, altered bhase, large seed sensecence, abnormal embryo development, altered phase of altered sensecence, abnormal embryo development, altered phase, large seed large and mass, large seed increased leaf prant, large seed large and mass, large seed increased ant
                                                                                                       New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmocic stress cany of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                              responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparasitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                      new isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

The present invention describes an isolated WHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II beta beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, where the effector component is linked to the MHC class II component. Also described: (l) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying in a subject; (5) a method of treating an immune disorder in a subject; and can be used for treating an immune esponse ex vivo in a subject; and (7) a method of treating an immune response ex vivo in a subject; and (7) a method of treating an immune disorder ex vivo in a subject; and (7) a method of treating an immune disorder and immunosuppressive activities, and can be used in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune catcivities, and can be used in gene therapy. The MHC class II compound infections, parasitic infections, neoplastic disease, autoimmunity or toxicity. The present sequence represents a spaceholder invention.

The MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Buchrieser C, Frangeul L, Couve E, Rusniok C, Faihi H, Dehoux P; Daussurger O, Chetouani F, Nedjari H, Glaser P, Kunst F, Cossart P; Daniels J, Goebel W, Kreft J, Kuhn M, Ng E, Varquez-Boland JA; Dominguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend A; Charbatery T, Domann E, Hain T, Berche P, Charbit A, Durant L; Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N; Maduenio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J; Rose M, Voss H;
treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to the genome sequence of Listeria

CC monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of

CC it are useful for selecting probes and primers for detecting genes in L.

CC monocytogenes and related organisms, and for studying genetic

monocytogenes and related organisms, and for studying genetic

CC polymorphisms and other genomes. The present sequence is a protein

CC polymorphisms and other genome sequence of the present invention. Proteins

CC antibodies, identification of L. monocytogenes and related organisms, and

CC antibodies, identification of L. monocytogenes and related organisms, and

CC in biosynthesis and biodegradation, especially biosynthesis of vitamin

CC antibodies is and biodegradation, especially biosynthesis of vitamin

CC in biosynthesis and biodegradation, especially biosynthesis of vitamin

CC selecting compounds that regulate gene expression and cell replication

CC selecting compounds that regulate gene expression and cell replication

CC selecting compounds that regulate gene expression and cell replication

CC selecting compounds that regulate gene expression and cell replication

CC selecting compounds that regulate gene expression and cell replication

CC selecting compounds that regulate gene expression and cell replication

CC sequence and proteins encoded by it are useful in pharmaceutical and

CC vaccines compositions for the treatment or prevention of infections by L.

CM monocytogenes and related organisms. Note: The sequence data for this

CM patent did not form part of the printed specification, but was obtained

CM patent form part of the printed specification, but was obtained

CM patent form part of the printed specification, but was obtained

CM patent form part of sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drosophila; developmental biology; cell signalling; insecticide; pharmaceutical.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIPI5-like transcription factor activity, caleosin-like activity, ATP citrate lyase activity, SNF1-like activity and CKC-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) complement (II) of (I); (2) a chimeric construct (III) comprising (I) or (III), operably linked to a regulatory sequence; (3) a plant (IV); and (5) comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleotide fragment encoding polypeptides having receptor-like protein kinase activity, caleosin-like activity, useful for altering oil phenotypes in plants such as sunflower, coconut, soybean, wheat and rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B;
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapoutics and pharmaceutical drugs. The invention siscloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB27737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention
oil obtained from (V). (I) or its part can be used in antisense inhibition or co-suppression in a transformed plant. (III) is useful for altering the oil phenotype in a plant such as corn, soybean, wheat, rice, canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACCOOGSE to ACCOOGSE and ABR40591 capesent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel abiotic stress responsive polynucleotides

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL35511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense, prokaryotic essential gene, cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest and for sEQ IDS 9692-16825 represent a group of 7134 Mxyococcus xanthus proteins and peptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                    The invention features to an isolated muclead acta compirising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid conformation and inhibited by the antisense accidenceding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated conformation and inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular contineration; (7) identifying a compound that influences the activity of the polypeptide for proliferation or that has an activity against a biological pathway required for that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) contained for proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibictic; (10) profiling a compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism acts; (9) manufacturing an antibictic; (10) profiling a compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism. The strains; or compound that inhibits the conformation of an organism. The antitiense nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, conformative for proliferation in cells other than S. aureus, S. typhimurium, conformation in electronic format directly from MIPO at equired format dined formation or the parent sequence is encoded by one of the print in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antialergic; hepatotropic; antidiabetic; antiinflammatory; antiviral; antialergic; hepatotropic; antidiabetic; antifinflammatory; antiviral; antionavulsant; antibacterial; antibacterial; antitungal; antiparasitic and cardiant activity. The polymucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The mucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's datisease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; neurological diseases such as cerebral anoxia and epilepsy; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                               Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins ABES9711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the

The present invention relates to a novel recombinant DNA polynucleotide comprising a cell cycle regulated promoter, such as a cyclin promoter, that functions in plants operably linked to a DNA polynucleotide encoding an isopentenyl transferase. The present sequence is one such isopentenyl transferase. The present sequence is one such isopentenyl transferase. Also claimed are transgenic plants comprising the recombinant DNA polynucleotide. The recombinant polynucleotide is useful for producing transgenic plants expressing cytckinin biosynthetic genes, and also provides an improved method of producing transgenic plants with increased yield and vigor. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics.
                                                                                              New recombinant DNA polynuclectide comprising a cell cycle regulated promoter and encoding an isopentenyl transferase, useful for producing transgenic plants expressing cytokinin biosynthetic genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 37; DB 10; Length 455; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated polynucleotide comprising a plant promoter directing transcription of an operably linked polynucleotide in at least one of the tissues selected from abscrission zone, root, pod, wall, apical meristem, and flower of plants. The polynucleotides and methods are useful for producing a plant having increased yield or a trait of agronomic interest when compared to a nontransformed plant of the same genotype. The present sequence represents a IPP-like structural protein. The sequence data for this patent is not represented in the printed specification but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic plant; plant breeding; isopentenyl transferase; enzyme; plant
                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides comprising a plant promoter that directs its transcription into abscission zone(s), root, pod, wall, apical meristem, or flower of plants, useful for producing a plant having increased yield or agronomic trait.
                                       abscission zone; apical meristem; Plant Growth Regulant; Gene Therapy; A6; abscission zone promoter; IPT; isopentyl transfease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense, prokaryotic essential gene; cell proliferation, drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid comprising any one of

the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway is dentifying a gene required for cellular proliferation; (8) constitution or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; sactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimmrium, K. pneumoniae or P. aeruginesa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparastic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection, neoplastic disease; autoimmunity; toxicity; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New MHC class II compound, useful for preparing a composition for treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
```

The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II clapha chain and at least a portion of an MHC class II alpha chain and MHC class II beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component. Also described: (1) a pharmaceutical composition class II component. Also described: (1) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of regulating an immune disorder in a subject; (6) a method of regulating an immune response ex vivo in a subject; and concept composition for treating an immune disorder ex vivo in a subject; (1) has vivoide, antibacterial, antiparasitic, cytostatic and immunosuppressive civicuites, and can be used in gene therapy. The MHC class II compound (1) can be used for preparing a composition for treating immune cativities, and can be used in gene therapy. The MHC class II compound for infections, parasitic infections, neoplastic disease, autoimmunity or toxicity. The present sequence represents a spaceholder molecule peptide, which can be used in the present invention. Claim 11; SEQ ID NO 3; 92pp; English

New polypeptides and encoding polynucleotides, useful for diagnosing, preventing and/or treating lung cancer.

Example 38; SEQ ID NO 2064; 258pp; English.

The invention relates to novel compositions and methods for the therapy

and diagnosis of cancer, particularly lung cancer. The compositions comprise one or more lung tumour polypeptides, immunogenic portions therof, polynucleotides that encode such polypeptides, antigen presenting cells that expressing such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have cytostatic and immunostimulant activity. The lung tumour antigens can be used in the creation of a vaccine. The polynucleotides that encode the lung tumour polypeptides can be used in gene therapy to help in the treatment of lung tumours. This sequence represents a human lung tumour clone polypeptide of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property Organization CD ROM supplied with the specification.

ö
cells isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer-related peptide of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vedvick TS;

Sequence 148 AA;

```
The invention relates to a novel isolated polynucleotide comprising a sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cytostatic applications and may be useful for detecting and treating lung cancer in a patient, as well as for inhibiting the development of lung cancer in a patient via incubating CD4+ and/or CD8+ rells isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated related related peptide of the invention. The current sequence is that of the human lung cancer-related peptide of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

18 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABBS70777-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences Disclosure; SEQ ID NO 38739; 21pp + Sequence Listing; English.

new recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.

WPI; 2004-757369/74.

Claim 2; SEQ ID NO 9672; 14pp; English.

The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 5244) and encoding a polypeptide with any of 5544 amino acid sequences [-5544) and encoding a polypeptide with any of 5544 amino acid sequences [-5544] and encoding a polypeptide with any of 5544 amino acid sequences of 545-11088. The CDNAs and proteins are from corn, soybean, arbaidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region functional in a plant cell operably joined to a polynucleotide encoding a plant. The property is selected from improving plant cold tolerance, for plant. The property is selected from improving plant cold toleransformed plant. The property is selected from improving plant cold tolerance, for providing increased cresistance to plant disease, for galactomannan production, for improving plant tolerance to herbicides, for increasing the rate of improving plant tolerance to herbicides, for increasing the rate of improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for modifying seed oil yield improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
          also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and genetics, in particular for producing transgenic plants with improved biological characteristics such as increased yield, improved nitrogen flow, increasing plant tolerance to cold or heat, improving plant tolerance to extreme osmotic and drought conditions, and improving plant tolerance to plant pesters or pathogens. They can also be used in physical arrays of molecules, plant beceding markers, computer-based storage and analysis systems. The present sequence is one of the 5544 plant protein of form part of the invention. Note: The sequence data for this patent did electronic format directly from USPPTO at sequence in uspto.gov/sequence.html?DocID=20040216190.

The invention relates to a new isolated lung specific nucleic acid
molecule (I) comprising any of 113 fully defined nucleotide sequences
given in the specification, their encoded protein sequences, sequences
given in the specification, their encoded protein sequences
calculusly hybridizing to the nucleotide sequences. The methods and
cat least 60% identity to the nucleotide sequences. The methods and
cannitoring of the present invention are useful for identifying,
cannecrous diseases of the lung. They are also used for identifying lung
cannecrous diseases of the lung. They are also used for identifying lung
cannecrous diseases of the invention, gene therapy, production of transgenic
minals and production of engineered lung tissue for treatment and
canneals of gene expression data in the LIFESEQ Gold database using the
data mining software package candidate lead automatic search program
(CLASP). Genes were grouped into gene bins where each bin is a cluster of
c sequences grouped together where they share a common contig.
Differentially expressed tissue-specific genes were selected based on the
                                                                                                                                                                                          ö
of Pseudomonas species using biochip technology. Sequences ABO67826-
BAD64396 represent P. aeruginosa polypeptides of the invention. Note: The
Sequence data for this patent did not form part of the printed
specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytostatic; gene therapy; vaccine; lung; diagnosis; cancer; non-cancerous lung disease; lung tissue; antagonist; gene therapy; transgenic animal; splice variant.

10
percentage level in the targeted tissue versus all the other tissues. The expression levels for each gene in libraries of normal tissues or non-tumour tissues from cancer patients were compared with the expression levels in tissue libraries associated with tumour or disease. This sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA asquences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila; developmental biology; cell signalling; insecticide;

The present invention describes primer sets for synthesising 5602 full-
complementary strand of a polynucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602
complementary strand of a polynucleotide which comprises one of the 5602
complementary strand of a polynucleotide which comprises one of the 5602
complementary strand of a polynucleotide which complementary to the
complementary strand of a polynucleotide complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which complementary to the
complementary strand of a polynucleotide complementary to the
complementary strand of a polynucleotide comprises a 1'-end sequence complementary to a
polynucleotide which comprises a 1'-end sequence complementary to a
coligonucleotide comprises a 1-end sequence, where the
coligonucleotide comprises as the selected from those defined in the
coligonucleotide comprises of the sequence, where the
coligonucleotide comprises of the primers also useful for the
collagonate collagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers also useful for the
collagonate collagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers also wseful for the
collagonate collagnosis of the abnormality of the primers also
collagonate collagnosis of the abnormality of the primers also
collagonateleotides, all of which are used in the exemplification of the
collagonateleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yamamoto J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 8; SEQ ID NO 14226; 2537pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                66.7%; Score 36; DB 4; Length 327; 69.2%; Pred. New Stomach cancer-associated genes, useful as markers in blood tests for screening for the early stages of the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to stomach cancer-expressed genes (AAI93842-AAI93917) and the encoded proteins (AAW93967-AAM94039). The genes can be used as markers in blood tests for screening for the early stages of the disease. The proteins and peptides can be used as targets for screening for compounds to treat the disease. They can also be used for predicting micro-metastases. The gene can predict peritoneal dissemination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ota T, Isogai T, Nishikawa T, Hayashi K, Saito K, Yamamoto J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N;Alternate names: membrane protein fsh, 205K
N;Contains: female sterile homeotic protein, 110K
C;Species: Drosophila melanogaster
C;Date: 03-Mar-1993 #sequence_revision 03-Mar-1993 #text_change 31-Dec-2004
C;Accession: A43742; B43742
C;Accession: A43742; B43742
Bay Batia-Dey, N.; Dawid, I.B.
A;Title: The Drosophila fsh locus, a maternal effect homeotic gene, encodes apparent A;Reference number: A43742; MUID:89276730; PMID:2567251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              C;Keywords: alternative splicing; transmembrane protein
